Kansas Jail Adopts State of the Art Ozone Laundry System! A 10 month payback period and the most Advanced Disinfection– all in one!

A modern 250-bed jail, the Butler County, Kansas Detention Facility opened in January 2003. The 72,000 square foot facility houses inmates not only from Butler County, but also supplies beds to the US Marshals Service, Immigration and Naturalization Service, and various other outside agencies.

After an Energy Audit conducted by Honeywell identified the laundry as a major consumer of utilities, water and harsh chemicals- the County began looking at ways to improve their laundry while cutting costs. Ozone was the answer! The Ozone Company was consulted and an extensive Saving Analysis was completed outlining past and present performance as well as a Pro Forma for future operations.

Butler County Kansas Detention Facility

The outcome was clear- major improvements and savings could be achieved by implementing the Eco-Wash system from The Ozone Company. Fully self contained, the State of the Art technology in the EW200-3 offered Butler County a payback of less than ONE year! Better yet, no changes were needed to the laundry or operations- the system is fully automatic and services all three 80lb. washers. The inmates process laundry much as they always have, only now they have advanced disinfection even against severe microbes like *MRSA*, HIV, drug resistant TB and all other microbes and so called Super Bugs.

Meanwhile the county and tax payer reap the financial benefits. With an ROI measured in months and an Internal Rate of Return (IRR) above 115%, the Ozone system was the number one investment that could be made in their county wide audit. Over the life of the equipment the ROI is expected to be a 10:1 return!

“The Smart Way to do Laundry!”™

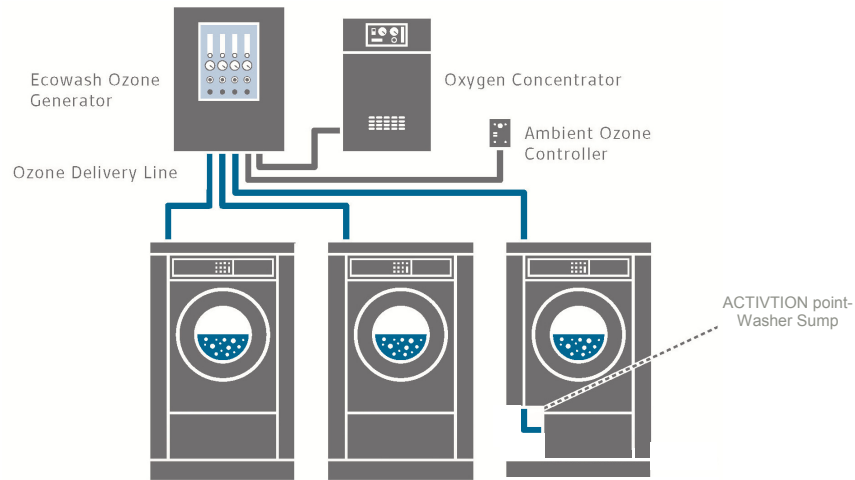

Wall mounting offers convenient & minimal footprint.

Three 80lb washers can process 240 lbs of laundry at once. Configuration was simple- one Triple Cell unit was installed handling all three washers independently or simultaneously. The ozone system continuously monitors the washers and automatically engages when one or more are activated. The Ozone system hibernates until needed.

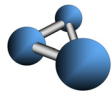

Operation is fully automatic. Inmates who work the laundry simply add the laundry to the machine and activate the desired laundry program as they always have. No inputs on the Ozone system are required.

PROFILE:

Eco-Wash TRIPLE Washer System EW 200-3

ONE Triple Cell unit was configured for the washers. Each washer is completely independent of the others. The system automatically monitors each individual washer for operation and comes online automatically or hibernates until needed.
